

A Study on Winning Strategies of the Generalized Chopsticks Game

Hanseul Cho | KAIST, Math. Sci. (Undergraduate student)

The chopsticks game is a famous traditional two-player finger game. To win the game, you should make the opponent fold all the fingers.

I. Research Objectives

1. We study which of the two players will win in **a conventional game**.
2. We aim to study if there is a winning strategy **as the number of digits is not even five**.
3. We aim to investigate whether there is a winning strategy for players as they **start the game, unlike the traditional rules**.

II. How to play chopsticks game

Conventional (or almost standard) rule of chopsticks game

1. When a round starts, both players hold their hands out and extend a finger in each hand. ((1,1), (1,1))
2. Choose a person to go first. Now the person is an **attacker (A)**, and the opponent is a **defender (D)**. They will then take turns going back and forth.
3. In every turn, the Attacker has two options: **Hit or Split**.

- ① **Hit:** Attacker taps one of the defender's non-zero hands with her one hand. **Defender will add the extended finger of the tapping hand and the tapped hand, and extend the sum on the tapped hand.** If the sum is 5 or more, the tapped hand becomes a 'dead hand' and will fold all its fingers.
- ② **Split:** Attacker taps both hands together to **redistribute her own fingers**, but does not just swap both hands. She can even return her dead hand into alive one by splitting.
 $2 + 0 = 1 + 1$
4. To win the game, you should make all of the opponent's hand dead(all fingers are folded).

III. Fundamental Defn. and Thm.

Definitions (No. 1):

- n = minimum number of fingers that makes the hand fold all its fingers. For instance, a conventional game is the game of $n=5$

Theorems (No. 1 / No. 2-3):

IV. Strategy Finding Algorithm

- Summary of the Algorithm:

1. Find all possible transitions
2. **Start from the situation that will end in a single turn**
3. Identify the outcome (Win or Lose) of each situation step by step, by **backtracking!**
4. Determine the strategic actions!

(The figure on the left briefly showcases the strategy finding algorithm using a table.)

$H[p,q]$: 'Hit q with p'; $S[p,q]$: 'Split into p and q';
 L : 'Attacker must Lose', $*$: 'Tie in the best case'

- Examples : $n=3, n=5$

$n=3$

A \ D	(1,0)	(1,1)	(2,0)	(2,1)	(2,2)
(1,0)	L	H[1,1]	H[2,1]	H[2,1]	H[2,1]
(1,1)	L	H[1,1]	S[1,1]	H[1,1]	H[2,1]
(2,0)	H[1,2]	H[1,2]	H[2,2]	H[2,2]	H[2,2]
(2,1)	H[1,2]	H[1,2]	S[1,1]	H[2,1]	H[2,1]
(2,2)	L	H[1,2]	L	H[2,2]	H[2,2]

$n=3$

A \ D	(1,0)	(1,1)	(2,0)	(2,1)	(2,2)
(1,0)	L	H[1,1]	H[2,1]	H[2,1]	H[2,1]
(1,1)	L	H[1,1]	S[1,1]	H[1,1]	H[2,1]
(2,0)	H[1,2]	H[1,2]	H[2,2]	H[2,2]	H[2,2]
(2,1)	H[1,2]	H[1,2]	S[1,1]	H[2,1]	H[2,1]
(2,2)	L	H[1,2]	L	H[2,2]	H[2,2]

$n=5$: Conventional Game

A \ D	(1,0)	(1,1)	(2,0)	(2,1)	(2,2)
(1,0)	L	S[1,0]	S[1,0]	S[1,0]	S[1,0]
(1,1)	L	L	S[1,0]	S[1,0]	S[1,0]
(2,0)	L	L	L	S[1,0]	S[1,0]
(2,1)	L	L	L	L	S[1,0]
(2,2)	L	L	L	L	L

✱ This table is based on computer programming. (coded with C)

V. Conclusions

1. We showed that the **second player will win in the conventional game** if both players act strategically.
2. We devised an algorithm using a **strategy table** that shows the outcome and strategy of each situation.
3. We observed that there are some rare **situations in which both players are tied**. If you start from those situations, you will enter the infinite loop, which consists of 3 or more situations.
4. (Additional) We rigorously proved some special cases of outcomes with our tabular method.
